

# SCADE LifeCycle Rapid Prototyper Basic Training

## Overview

# DESIGN A GRAPHICAL PANEL FOR SCADE SUITE

Create a New Graphical Panel

Connect Graphical Panel To SCADE Suite Model

Rapid Prototyper Tips with SCADE Suite

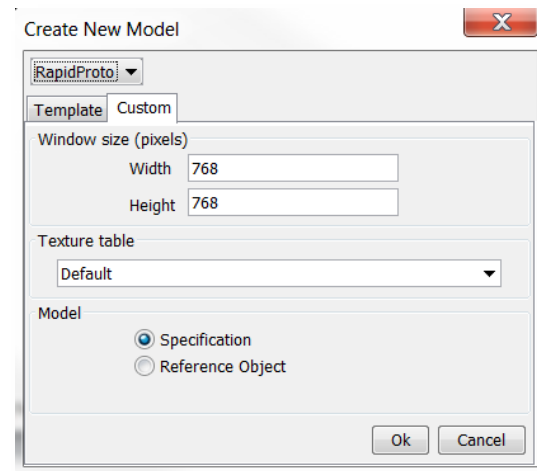

## From a Template

- File > New > X×Y Template
- Template presents templates of predefined sizes

## From Scratch

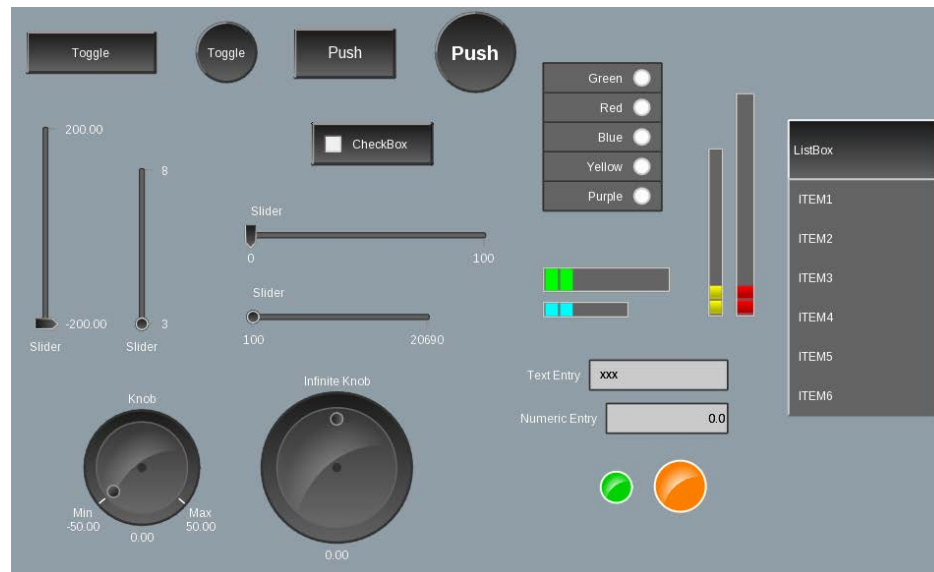

- File > New > Custom tab
  - Select a Specification model
  - Type the desired width and height

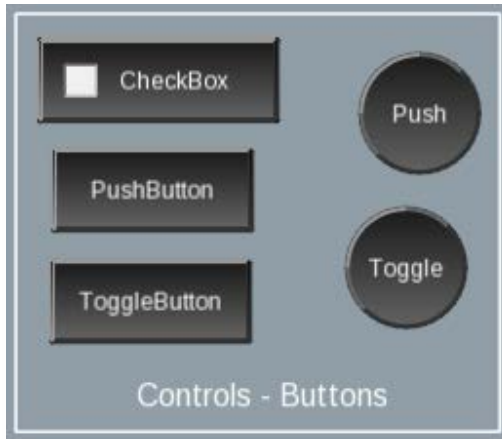

29 predefined widgets, including:

- Interactive control widgets: buttons, knobs, sliders, list boxes, radio buttons, text and numerical entry boxes, etc.
- Display widgets: LEDs, counters, text and numerical indicators, etc.
- Signal generators

Library of widgets can be user-customized/augmented

*Extract of the Rapid Prototyper Widget Library*

Push buttons, Toggle buttons, Checkbox  
to drive Boolean values

Listbox, Radio list, Rotary switch  
to drive enumerate & integer values

Sliders, Knobs (finite/infinite), Numerical edit box  
to drive real & integer values

Signal generators  
(ramp, rectangle, sinus, triangle)  
to drive real & integer values

LEDs  
to display Boolean values

Text Entry and Text Indicator  
to enter or display strings (array of char)

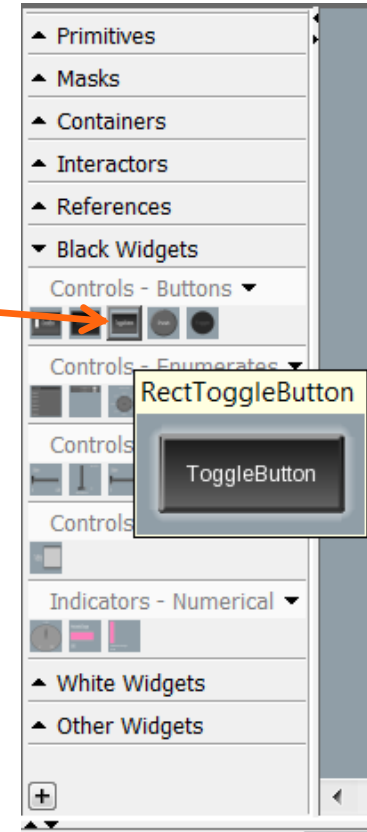

Counter, Gauges, Graph and Numerical Display  
to display real & integer values

Instantiate widgets in the graphical panel

- Select a widget in the objects creator toolbar

- Click in the Graphical Panel view to instantiate the widget

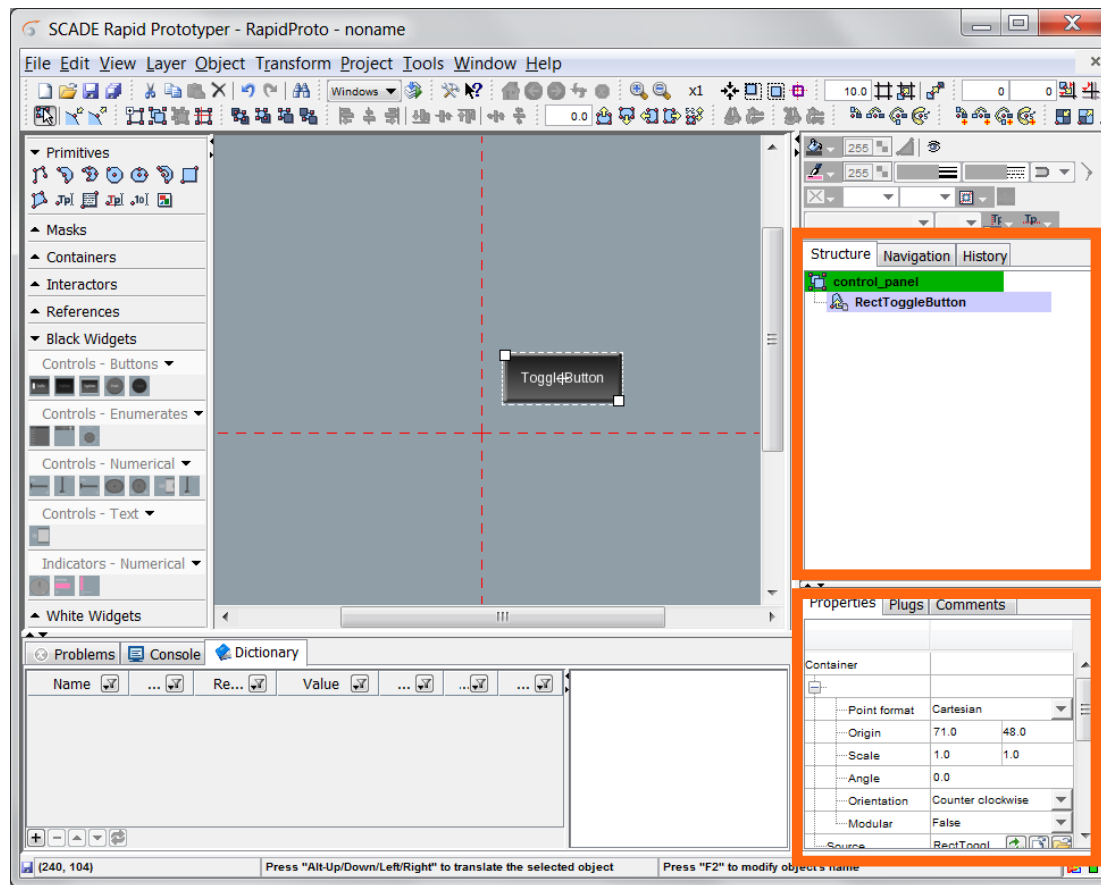

**Tip :** 2 libraries of similar widgets  
**Black and White**

# Design the Graphical Panel (2/6)

The widget is added to the Structure view of the graphical panel

Its properties appear in the Properties view

## Configure Widgets

- Move a widget
  - Click and hold to drag the widget and release the mouse to drop it in its new location

- Directly enter position coordinates in the properties view

| Properties           | Plugs             | Comments |
|----------------------|-------------------|----------|
| Container            |                   |          |
| RectToggleButton_ref |                   |          |
| Point format         | Cartesian         |          |
| Origin               | 113               | 30       |
| Scale                | 1                 | 1        |
| Angle                | 0.0               |          |
| Orientation          | Counter clockwise |          |

- With the translate toolbar, set the amount of pixels to move then click the direction button (top/bottom/right/left).

## Configure Widgets

- Resize a widget
  - Click and drag a control point of the widget

- Directly enter new size values in the properties view

|         |       |
|---------|-------|
| xLeft   | -50.0 |
| xRight  | 50.0  |
| yBottom | -20.0 |
| yTop    | 20.0  |

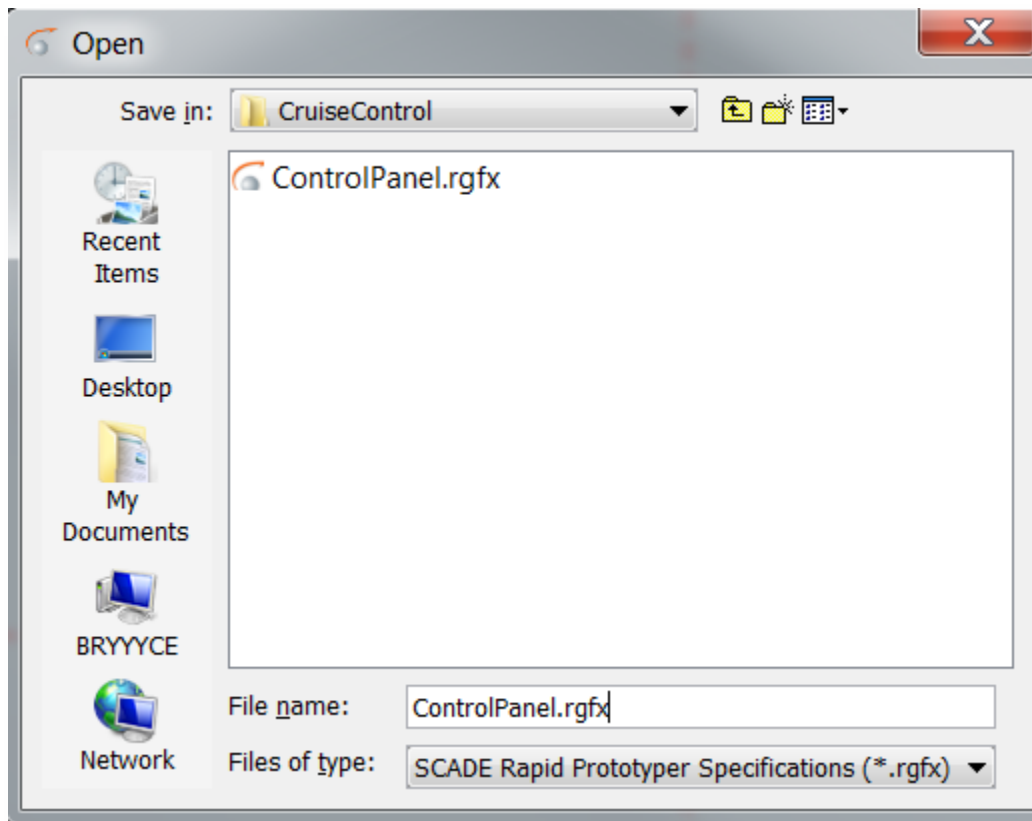

- Change displayed text on a widget

## Complete Graphical Panel

Save the Graphical Panel .rgfx

Create a counter with 2 functionalities:

- On/Off
- Counting up/Counting down

Note: The behaviour will be provided by a prerequisite SCADE Suite operator

Create a New Graphical Panel from template 768x768

Create a Design with:

- 1 toggle button for the On input:
  - origin -50, 0
- 1 push button for the Button input:
  - origin 50, 0
- An analog counter for the Count output:
  - origin: 0, 150
  - max : 100
  - min: -100

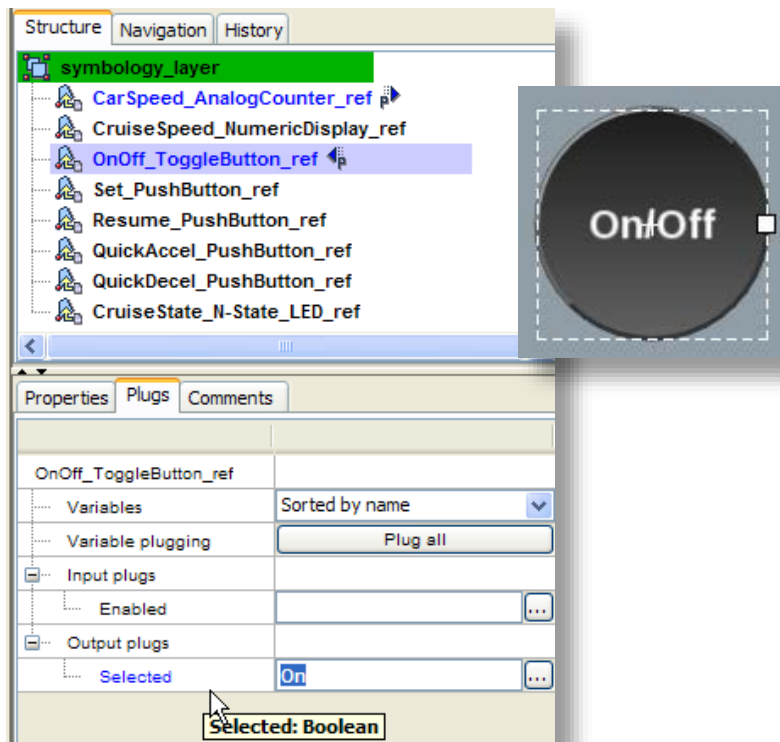

**Tip :** Use **Black Widgets**

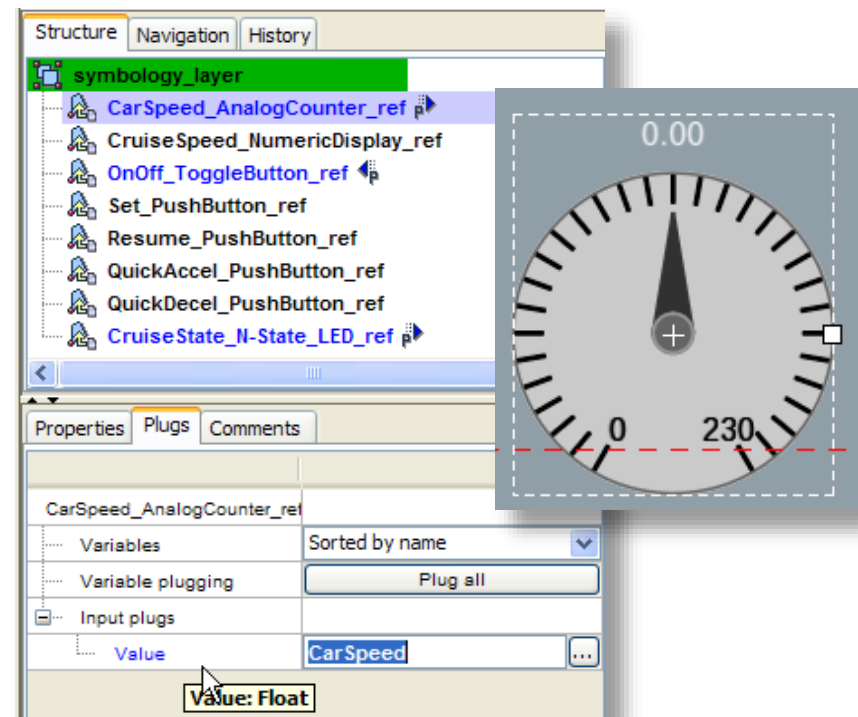

All widgets can be associated to input and/or output variables

- All control widgets can be Enabled/Disabled (input plug) and produce an output value or event (output plug)
- All indicator widgets display input values (input plug)

Push button control widget variables

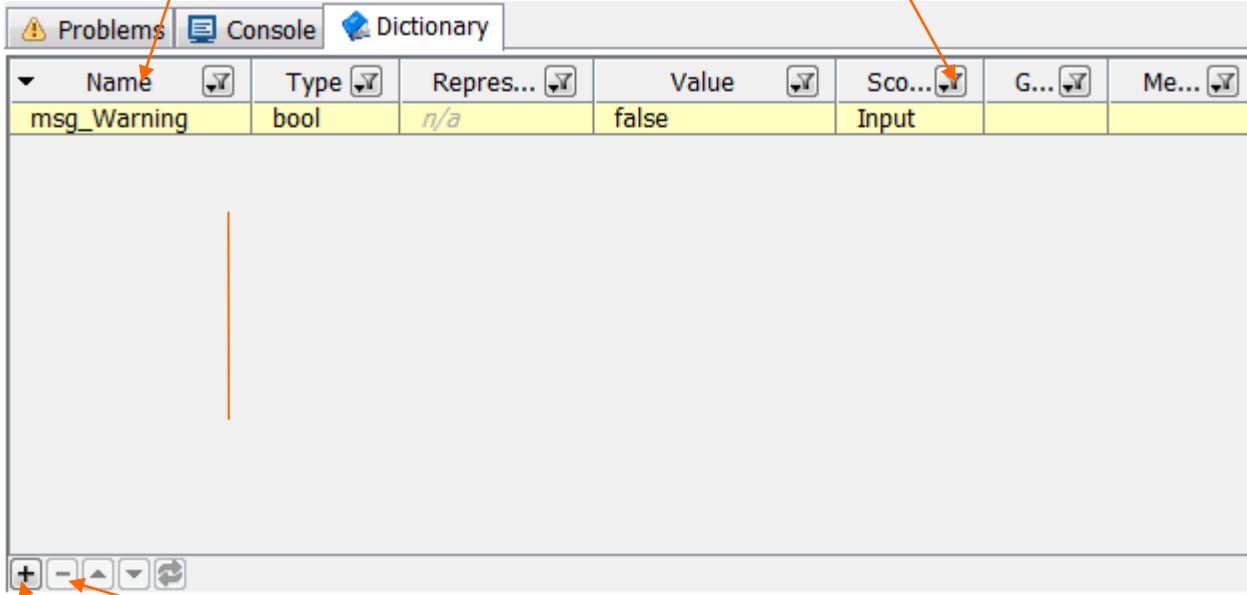

Counter indicator widget variables

Widgets variables are managed in a single location

**Tip #1 : The Data Dictionary allows copy/paste variables**

**Sort on column**

**Filter on column**

| Name        | Type | Repres... | Value | Sco... | G... | Me... |
|-------------|------|-----------|-------|--------|------|-------|
| msg_Warning | bool | n/a       | false | Input  |      |       |

**Create a new variable**

**Delete the selected variables**

**Tip #2: Use the Tab key to change the focus**

Go to Plugs tab to plug the variable:

- Associate the variable names to
- the available attributes / properties

|       |  |
|-------|--|
| LEDOn |  |
|-------|--|

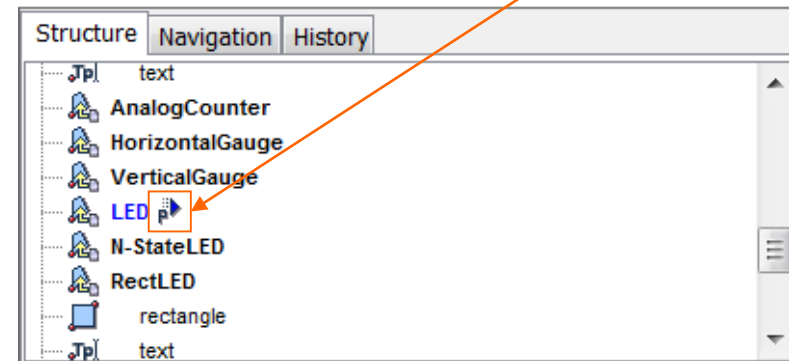

| Properties   | Plugs   | Comments |      |            |     |   |        |  |            |  |
|--|---|----------|------|------------|-----|---|--------|--|------------|--|
| <table border="1"><thead><tr><th>Name</th><th>Expression</th></tr></thead><tbody><tr><td>LED</td><td><input type="button" value="Create variables"/></td></tr><tr><td>Inputs</td><td></td></tr><tr><td>Visibility</td><td></td></tr></tbody></table> |   |          | Name | Expression | LED | <input type="button" value="Create variables"/> | Inputs |  | Visibility |  |
| Name   | Expression                                      |          |      |            |     |   |        |  |            |  |
| LED  | <input type="button" value="Create variables"/> |          |      |            |     |   |        |  |            |  |
| Inputs   |   |          |      |            |     |   |        |  |            |  |
| Visibility   |   |          |      |            |     |   |        |  |            |  |

- Once the variable name is entered into the text-field, the text turns blue to highlight the plugged attribute / property:

|       |             |
|-------|-------------|
| LEDOn | msg_Warning |
|-------|-------------|

“Plug” icon

A primitive plugged to at least one variable is highlighted in **blue** into the layer **tree sheet**

## 1. Add I/Os to the graphical panel created in the exercise 02-1

| Name          | Type | Repres...  | Value | Sco... | G... | Me... |
|---------------|------|------------|-------|--------|------|-------|
| <b>Value</b>  | real | <i>n/a</i> | 0.0   | Input  |      |       |
| <b>On</b>     | bool | <i>n/a</i> | false | Output |      | false |
| <b>Button</b> | bool | <i>n/a</i> | false | Output |      | false |

## 2. Plug

- Value on “Value” input of AnalogCounter, to recover counting value and to show
- On on “Selected” output of RoundToggleButton, to enable/disable the counter
- Button on “EvtClick” output of RoundPushButton, to command the counter

| Properties      |  | Plugs            | Comments |
|-----------------|--|------------------|----------|
| Name            |  | Expression       |          |
| RoundPushButton |  | Create variables |          |
| Inputs          |  |                  |          |
| Visibility      |  |                  |          |
| Origin          |  |                  |          |

# DESIGN A GRAPHICAL PANEL FOR SCADE SUITE

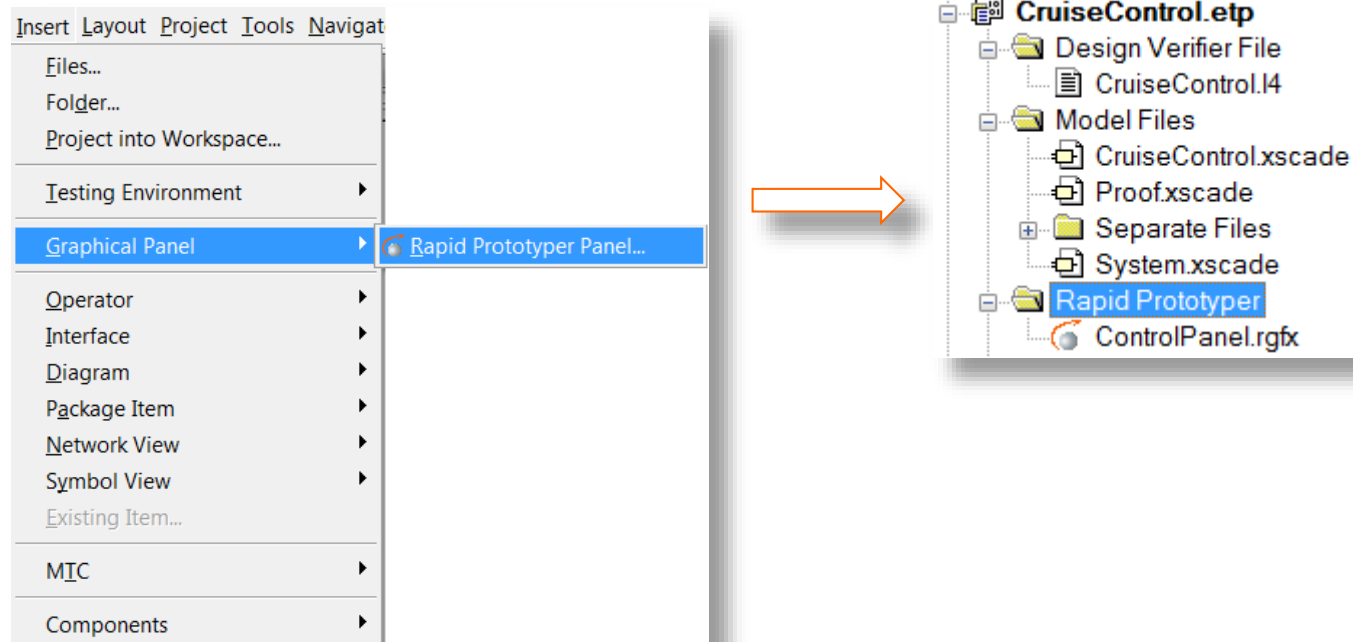

Create a New Graphical Panel

**Connect Graphical Panel To SCADE Suite Model**

Rapid Prototyper Tips with SCADE Suite

Insert > Graphical Panel > Rapid Prototyper Panel

- Select **.rgfx** file

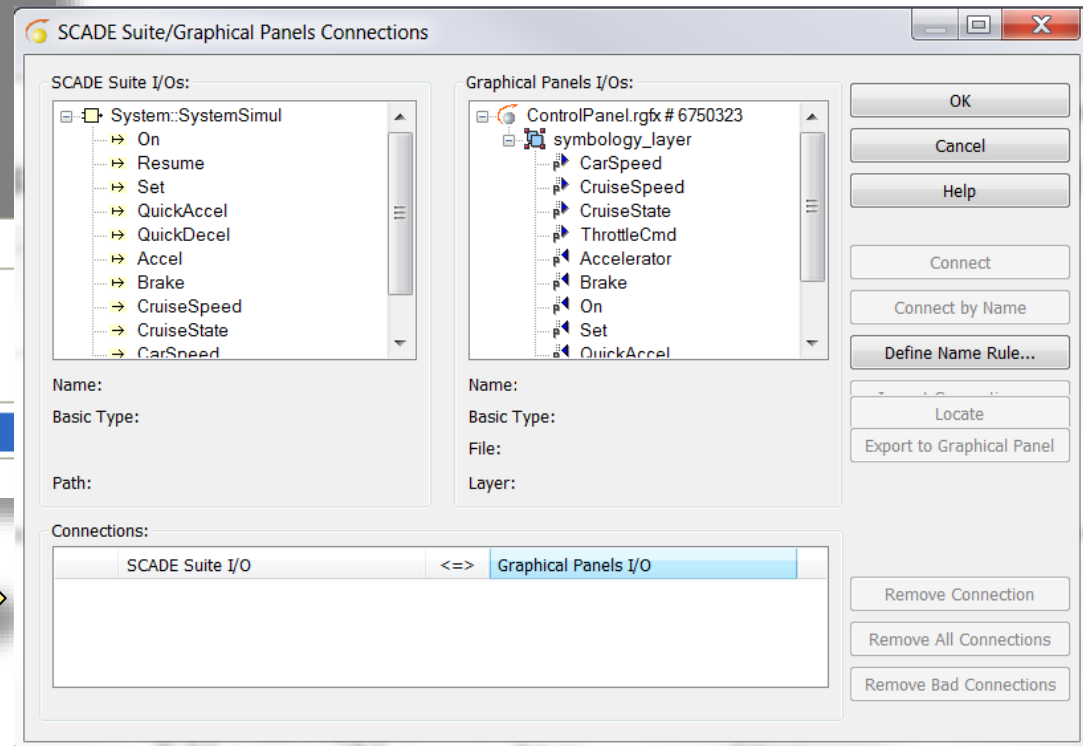

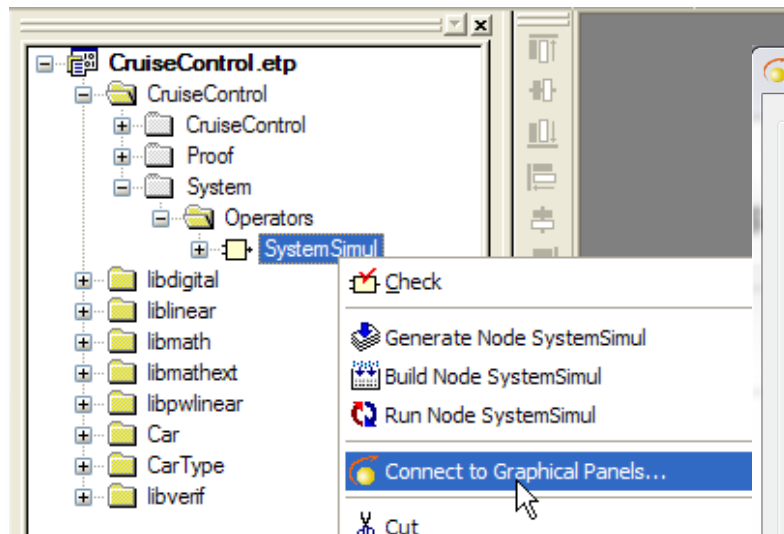

Double click on the **.rgfx** file to open the Rapid Prototyper Editor

**Note:** Several graphical panels can be associated to a single SCADE Suite project

# Connect Model I/Os to Graphical Panel I/Os (1/2)

Open the SCADE Suite/Graphical Panels Connections window

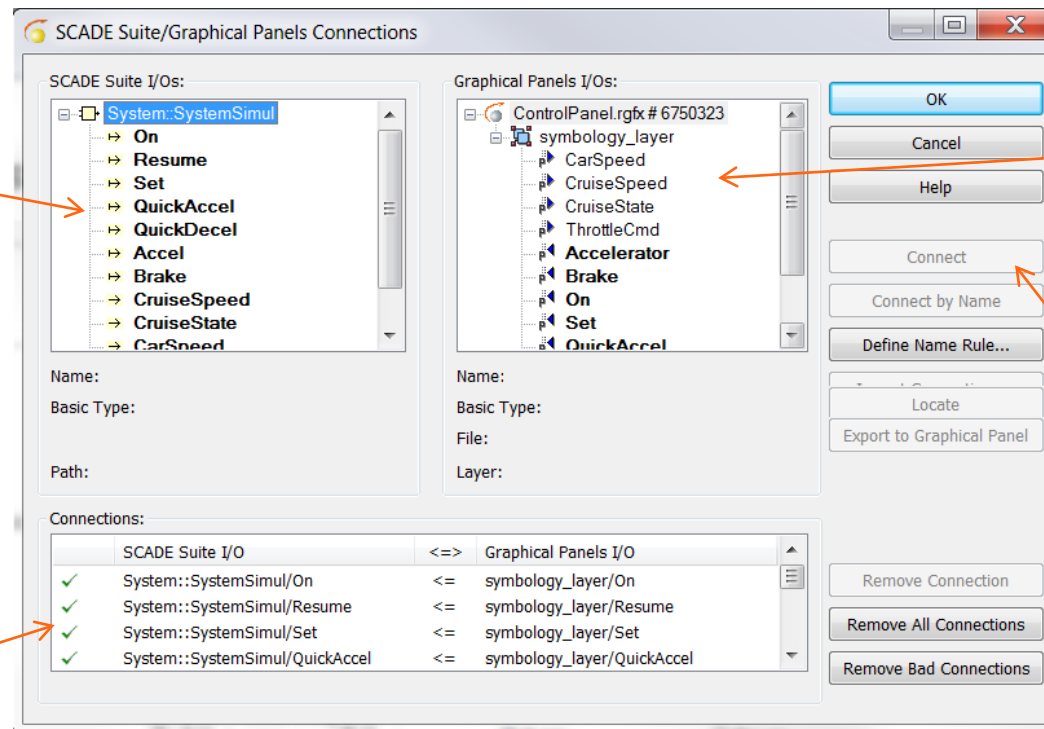

- Right-click on a SCADE Suite node > Connect to Graphical Panels...

# Connect Model I/Os to Graphical Panel I/Os (2/2)

Create the connections between model I/Os and graphical panel(s) I/Os

- Connect I/Os one-by-one, or automatically in a row
- Automatic connect by name can be used if I/Os share name patterns

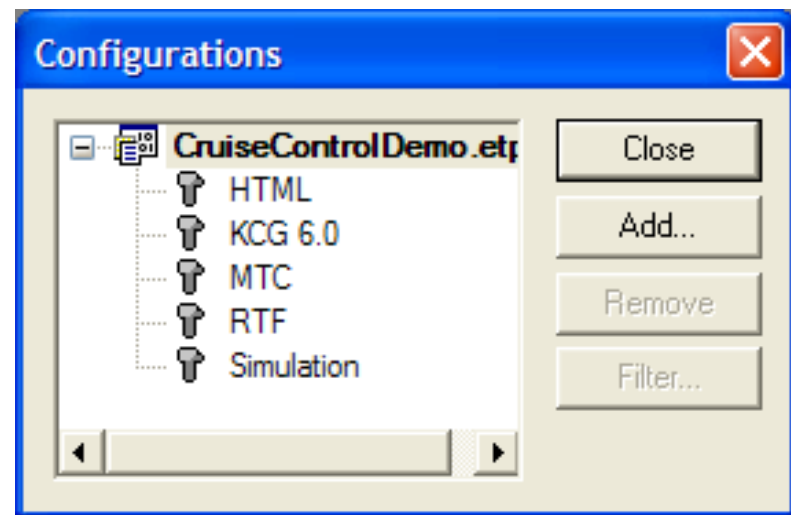

For each project, configurations can be added to the default configurations

Configurations allow you to save different code generation simulator/reporter options for different purposes for the same project

For example:

- A Rapid Prototyping
- a Standalone Executable

*How to do: Click on Project - Configurations*

# Perform SCADE Suite Interactive Simulation (1/2)

Create a Rapid Prototyping configuration

Configure interactive simulation session

Tip : Right click on Toolbar and select Code Generator to show configuration toolbar

**Note:** when the Integration Mode is set to Asynchronous, the graphical panel runs in parallel of the SCADE Suite simulator (in a dedicated thread, at its own rate). This allows pausing the simulator while still having the capability to manipulate the widgets to position simulation inputs.

When the Integration Mode is set to Synchronous, the graphical panel runs in synch with the simulator. When in pause, the widgets then cannot be manipulated.

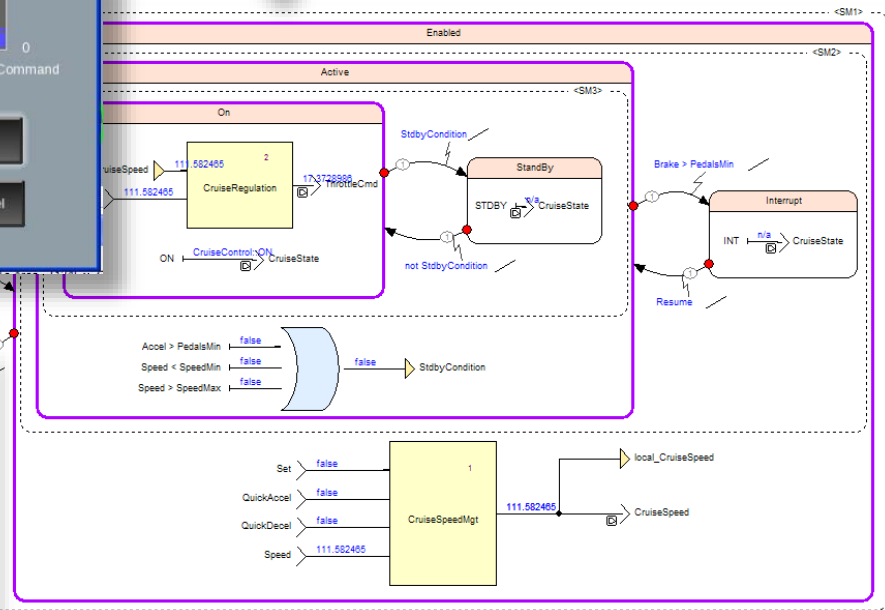

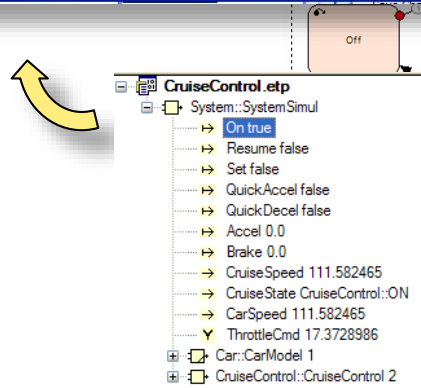

# Perform SCADE Suite Interactive Simulation (2/2)

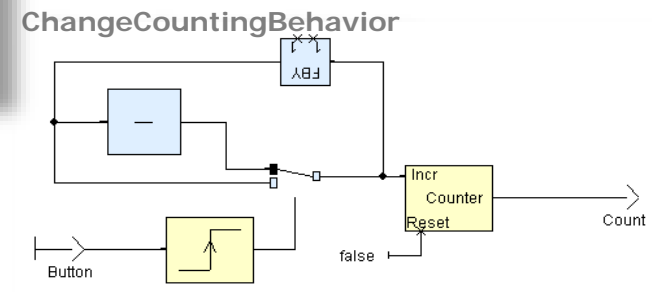

Run interactive simulation session

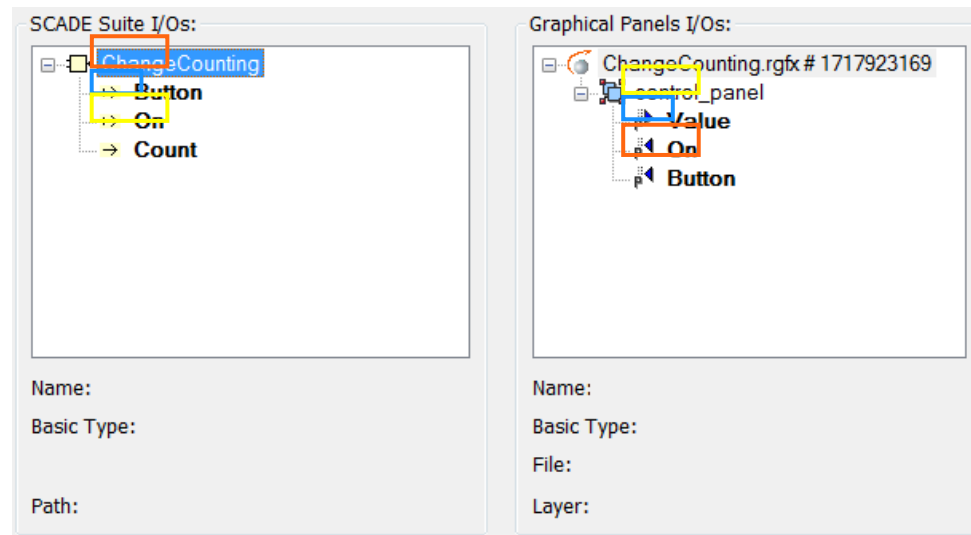

**Note:** *all SCADE Suite simulator features are available (continuous or step-by-step mode, breakpoints, play/record scenarios, save output files, etc.)*

1. Open the **ChangeCounting** SCADE Suite project in Prerequisites\Exercises\Exercise02-3 and **add** Graphical Panel developed in the previous exercise
  - This application changes counting mode (counting up/counting down) each time you press on a *Button* input and if you have switched *On* first.

2. Connect the RapidPrototyper Graphical Panel to the **ChangeCounting** SCADE Suite model

3. Simulate the SCADE Suite model with the graphical panel

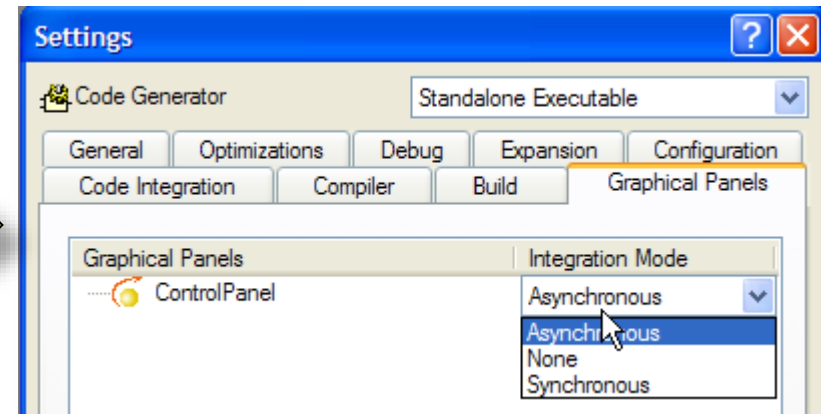

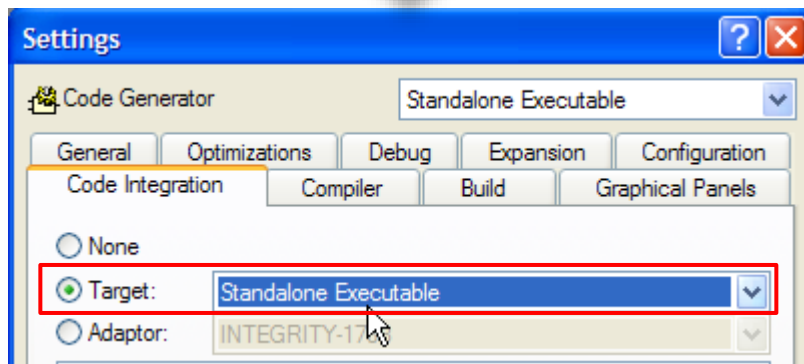

# Generate Standalone Executable from SCADE Suite (1/4)

Create a “Standalone Executable” configuration

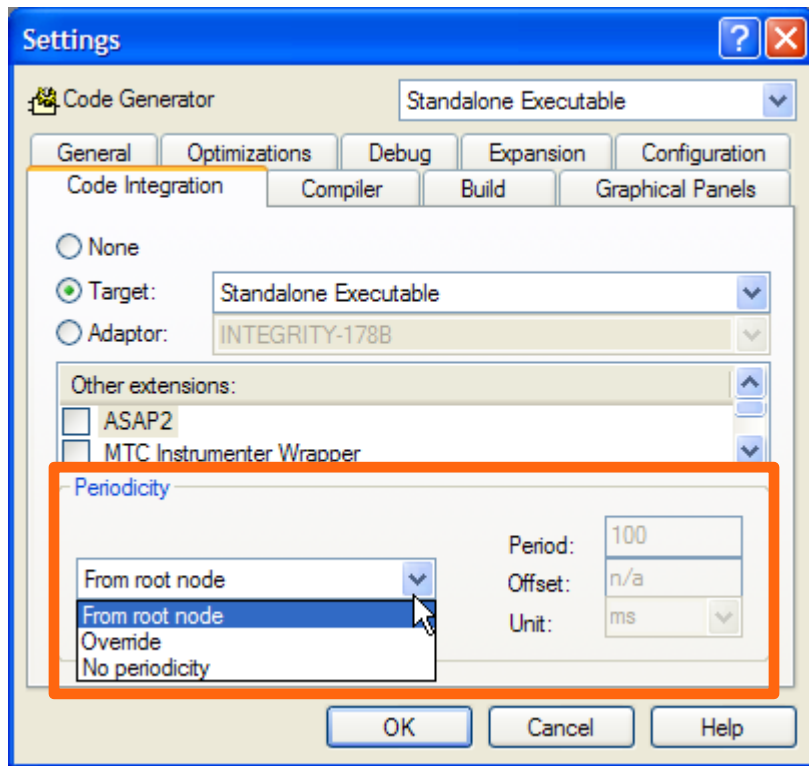

Configure standalone executable generation

- Select the “Standalone Executable” code integration target
- Select the graphical panels to be included

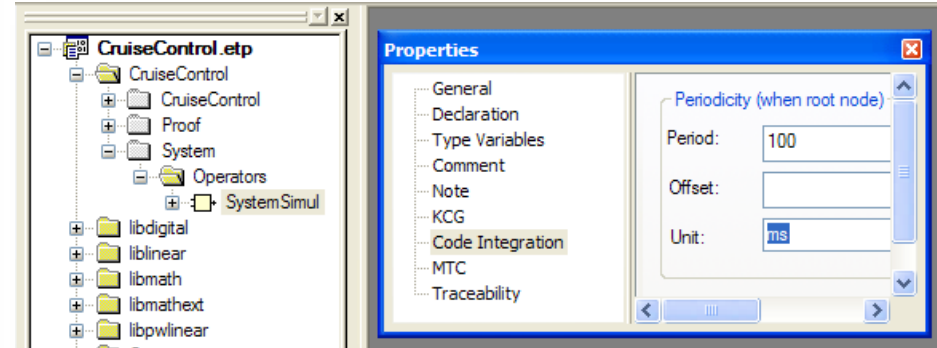

# Generate Standalone Executable from SCADE Suite (2/4)

Set the desired “Standalone Executable” periodicity (in  $\mu$ s, ms, or s)

**Note:** by default, the periodicity inherits from the code generation root node (default value = 100ms). The root node periodicity can nevertheless be overridden.

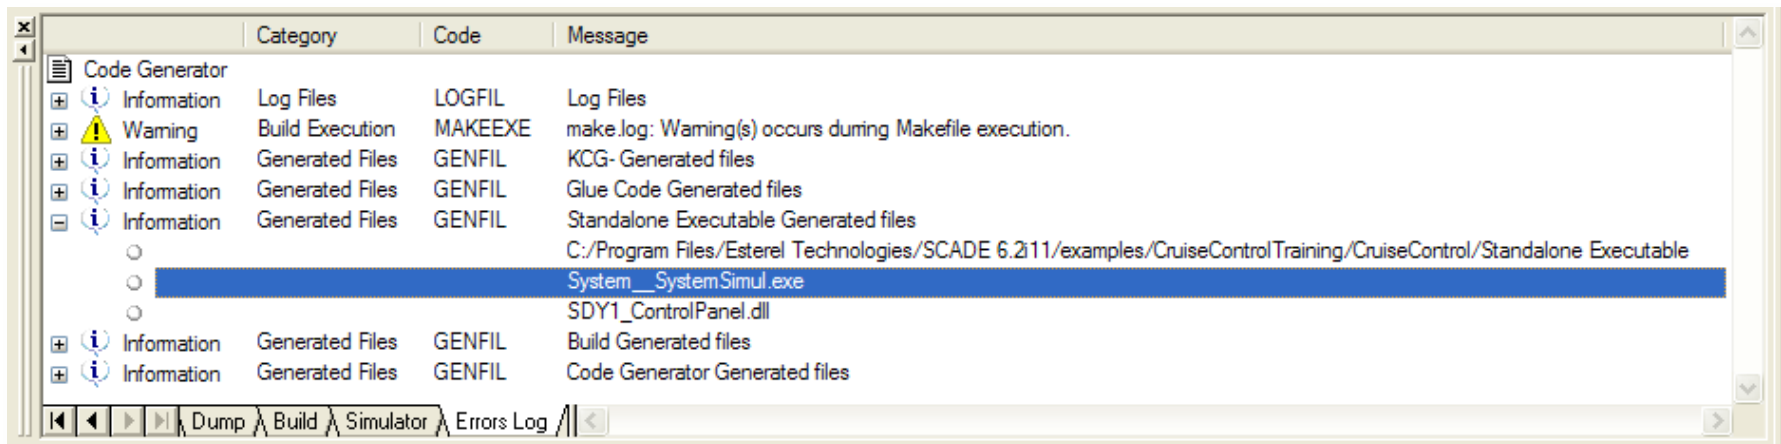

Node periodicity properties (when root)

# Generate Standalone Executable from SCADE Suite (3/4)

Generate standalone executable

- Name of generated file is: <package>\_\_<rootnodename>.exe

- Standalone executable can be run directly from SCADE Suite

# Generate Standalone Executable from SCADE Suite (4/4)

Standalone executable can be shared with colleagues, managers, customers, stakeholders, etc.

**Note:** Required files for standalone executable are:

- <Package\_RootNodeName>.exe
- RPFonTS.dll
- <SDYx\_GraphicalPanelName>.dll

Generate and run a Standalone Executable from ChangeCounting  
SCADE Suite model

# DESIGN A GRAPHICAL PANEL FOR SCADE SUITE

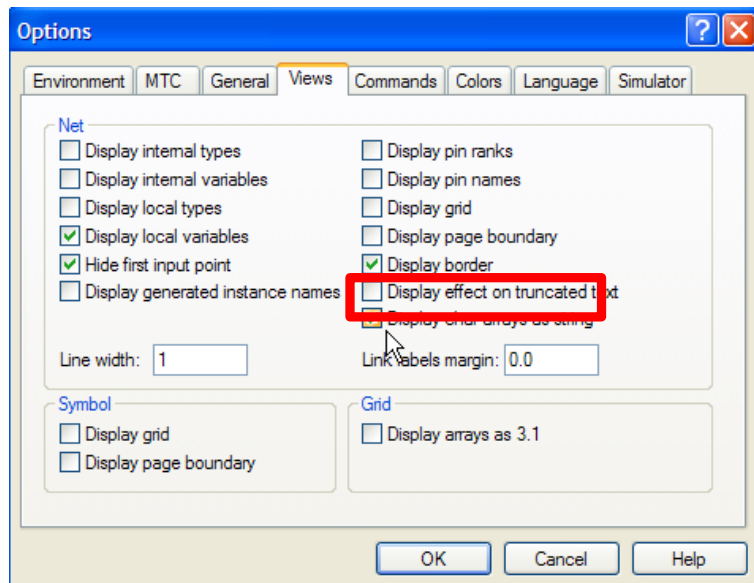

Create a New Graphical Panel

Connect Graphical Panel To SCADE Suite Model

**Rapid Prototyper Tips with SCADE Suite**

## a) Manipulating strings as arrays of SCADe char

- Strings are implemented as arrays of chars
- A tool option enables entering, and displaying, arrays of SCADe chars between double quotes
  - Tools > Options... > Views > Display char arrays as string

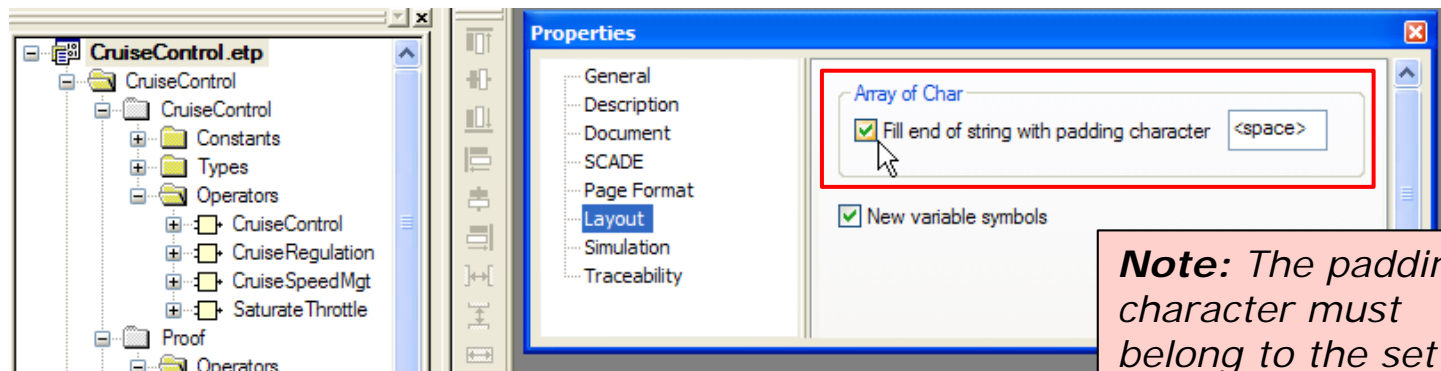

| Constant | Type    | Value   |
|----------|---------|---------|
| MyString | char ^5 | "Hello" |

=

| Constant | Type    | Value |
|----------|---------|-------|
| MyString | char ^5 |       |
| 0        | char    | 'H'   |
| 1        | char    | 'e'   |
| 2        | char    | 'l'   |
| 3        | char    | 'l'   |
| 4        | char    | 'o'   |

## b) The notion of “padding” character

- A project option (.ETP properties) enables automatically filling the end of strings with a padding character (default padding = <space>)

**Note:** The padding character must belong to the set of characters of the

| Constant | Type     | Value |
|----------|----------|-------|
| MyString | char ^10 |       |
| 0        | char     | 'H'   |
| 1        | char     | 'e'   |
| 2        | char     | 'l'   |
| 3        | char     | 'l'   |
| 4        | char     | 'o'   |
| 5        | char     | ''    |
| 6        | char     | ''    |
| 7        | char     | ''    |
| 8        | char     | ''    |
| 9        | char     | ''    |

Padding  
char =  
<space>

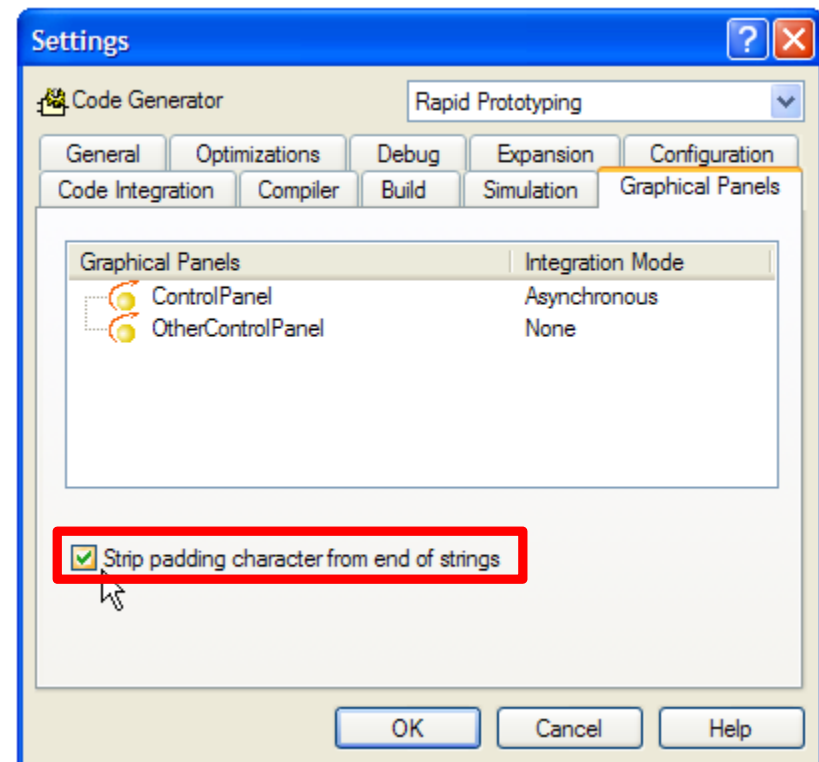

| Constant | Type     | Value   |
|----------|----------|---------|
| MyString | char ^10 | "Hello" |

Padding  
char = X

| Constant | Type     | Value |
|----------|----------|-------|
| MyString | char ^10 |       |
| 0        | char     | 'H'   |
| 1        | char     | 'e'   |
| 2        | char     | 'l'   |
| 3        | char     | 'l'   |
| 4        | char     | 'o'   |
| 5        | char     | 'X'   |
| 6        | char     | 'X'   |
| 7        | char     | 'X'   |
| 8        | char     | 'X'   |
| 9        | char     | 'X'   |

**Note:** possibility to use  
\x00 (NULL) as padding  
character with SCADE  
Suite KCG 6.4

- c) Using strings in Rapid Prototyper graphical panels
- SCADE LifeCycle Rapid Prototyper is manipulating strings as arrays of 256 characters
  - During interactive simulation, or in standalone executables, stripping the padding character from the end of strings allows “cutting” the array of SCADE chars at the right place in order to display ONLY the effective characters in graphical panels (not the padding chars)

Display This Text!! HelloXXXXXXXXXX

*Note: possibility to use \x00 (NULL) as padding character with SCADE Suite KCG 6.4*

During simulation sessions, SCADE Suite inputs are \_driven\_ by the graphical panel:

- At each computation cycle, the input value comes from the panel

The user can Disconnect the Inputs from Graphical Panels:

This allows:

- Performing step-by-step debug, when the user needs to enter “exact” values through the SCADE Suite simulator GUI
- Or loading, and playing a pre-recorded SCADE scenario (eg. at the beginning of a session) before reconnecting the graphical panel inputs

# Exercises Solutions

|                          |                       |   |
